

Making Sense of the Variability of Coastal Ocean Acidification:

Potential Long-Term Impacts on the Oyster Aquaculture Industry

Measuring “Ocean Acidification”

Inorganic Carbon

- ▶ Aragonite saturation value (actually needed)

Measuring “Ocean Acidification”

Four Parameters

- ▶ Four parameters – Any two parameters can define carbonate speciation
 - ▶ **pH**
 - ▶ measure of hydrogen ion concentration
 - ▶ **Total Alkalinity (AT)**
 - ▶ the excess of bases (proton acceptors) over acids (proton donors) in solution
 - ▶ **Total CO₂ (TCO₂)**
 - ▶ measure of carbon dioxide which exists in several states
 - ▶ **pCO₂**
 - ▶ the partial pressure of carbon dioxide, a measure of the relative concentration of the gas in air or in a fluid

Measuring “Ocean Acidification”

Aragonite vs Calcite

$$\Omega = [\text{Ca}^{2+}] [\text{CO}_3^{2-}] / K_{\text{sp}}$$

$\Omega > 1$, supersaturated $\Omega < 1$ undersaturated

$\Omega < 2$ can inhibit growth

Measuring “Ocean Acidification”

CO2 Sys

The screenshot displays the CO2calc 1.2.9 software interface. The main window is titled "Input" and "Results". It contains several sections for data entry:

- Sample Information:** Fields for Name (6 chars), Date (dd/MM/yyyy), Latitude (N/S), Comment, Time (hh:mm), and Longitude (W/E).
- File Capture:** A checkbox for "Record" and a field for "File Name".
- Physical Data:** Fields for Salinity, temperature(C), and Pressure (dbars).
- Carbonate Data:** Fields for TA (μmol/kgSW), TCO2 (μmol/kgSW), pH (chosen scale), fCO2 water (μatm), and pCO2 water (μatm).
- Nutrient Data:** Fields for Total P (μmol/kgSW) and Total Si (μmol/kgSW).
- Adjusted Conditions:** Fields for Temperature (C) and Pressure (dbars).
- Air-sea Flux:** Fields for pCO2 Air (μatm) and Windspeed (m/s).

At the bottom, there is a "Preferences" section with options for CO2 Constants (Salinity = 0 (freshwater): K1, K2 f), KHCO4 (Dickson, 1990), pH Scale (NBS scale (mol/kg)), Total Boron (Lee et al., 2010), and Air-sea Flux. A "Process" button is located at the bottom right.

Inputs: PCO₂, pH, Temperature, Salinity
Outputs: TCO₂, TA, Ωar

Variability on coastal pH and pCO₂

Less well-buffered

- ▶ Respiration
 - ▶ Phytoplankton blooms
- ▶ Storms
 - ▶ Freshwater input
 - ▶ Deep mixing
- ▶ Coastal Upwelling and other physical processes
 - ▶ Stratification (isolated water masses)

- ▶ Diurnal variability
 - ▶ Lower pH at night by 0.3

Three examples of damage to oyster larvae from ocean water acidity and low available carbonate, compared with healthy larvae on left. Micrograph by OSU

Clark and Gobbler, 2016).

Salisbury et al., 2009; Hunt et al., 2014; Gledhill et al., 2015;
Salisbury et al., 2015; Kaspenberg and Hofmann, 2016

Impacts on Oysters

- ▶ Low pH yields low aragonite saturation
 - ▶ Inhibit shell development
 - ▶ Delay metamorphosis
 - ▶ Slow growth
 - ▶ Kill shellfish
- ▶ Multiple stressors
 - ▶ pH
 - ▶ Temperature
 - ▶ Food
 - ▶ Pollution

Barton et al. 2012

Impacts on Oysters

- ▶ Hatcheries treat water
 - ▶ Understanding drivers will help managers decide on timing
- ▶ Timing in upwellers
- ▶ Moved from upwellers to mesh bags
- ▶ Remove oysters in the winter

<http://blog.masssoyster.org/>

Approach

Specifications

- ▶ Instrument mounted on fixed pier
- ▶ Grid powered
- ▶ Pumped system - flow through
- ▶ pH and pCO₂ (SAMI-pH and SuperCO2 from Sunburst Sensors)
- ▶ Additional Temp, Salinity, CDOM, turbidity, Chl.
- ▶ Redundant local data storage
- ▶ 3G Cellular telemetry
- ▶ 10' Interval measurements
- ▶ Daily calibration with CO₂ standards (200, 300, 400, 1000ppm)

Approach

Design Advantages

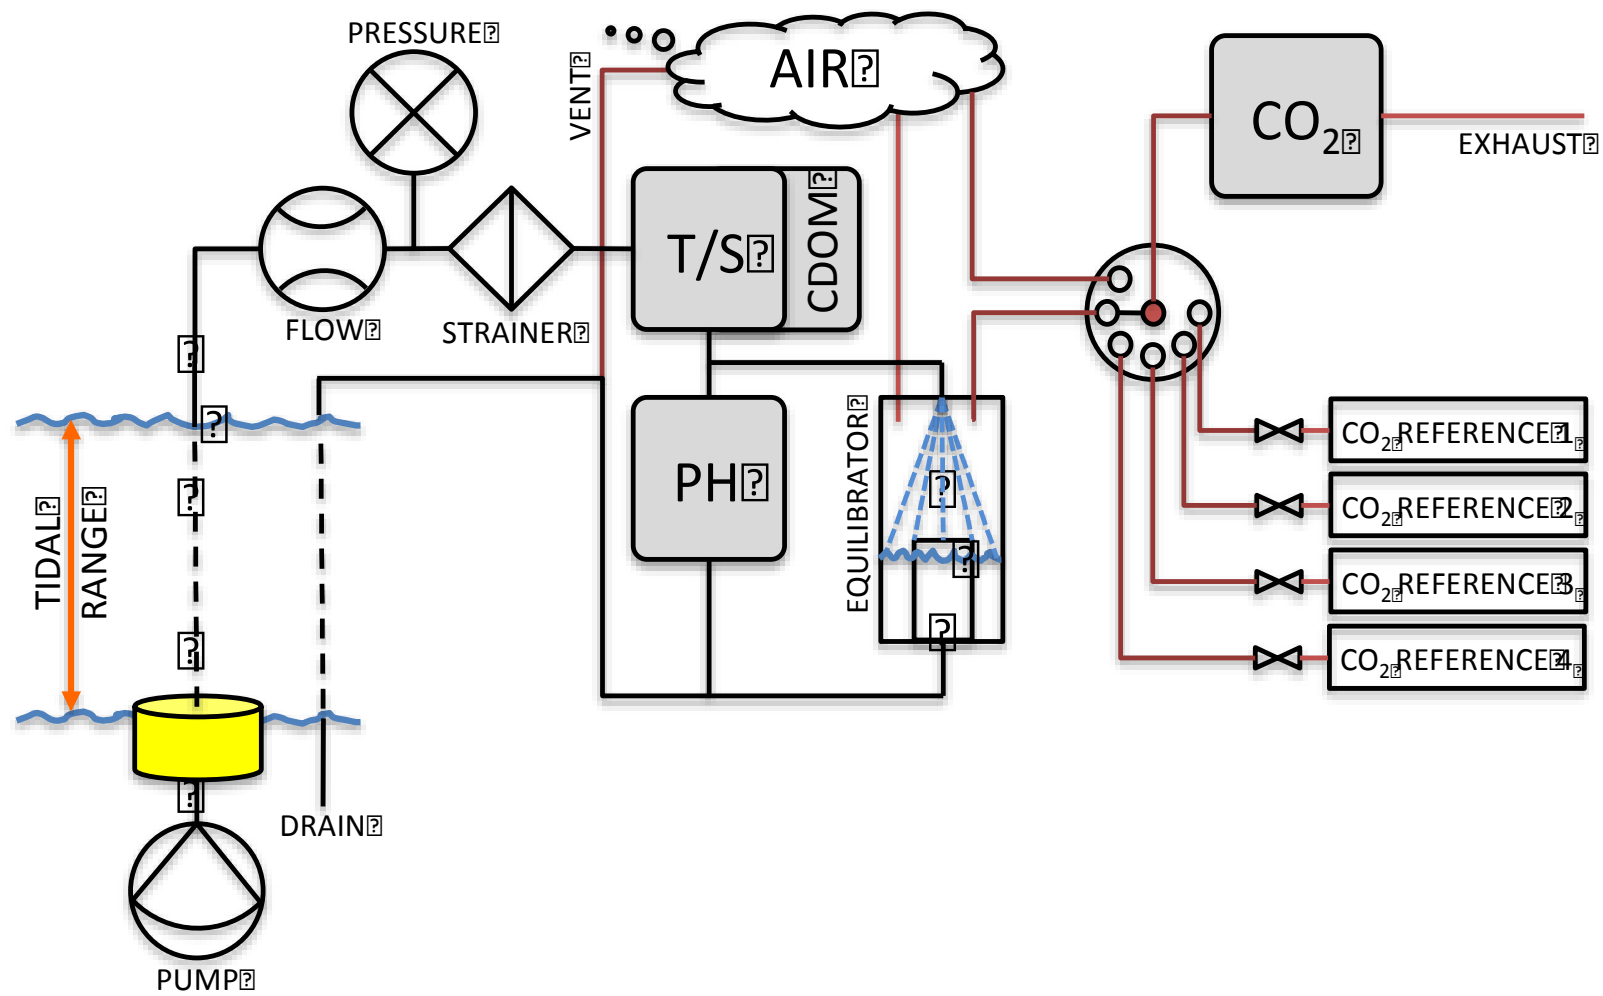

- ▶ pH: Colorimetric reagent method (SAMI-pH, Sunburst Sensors)
 - ▶ No drift
 - ▶ No calibration needed (no downtime)
- ▶ pCO₂:
 - ▶ Robust embedded LiCOR CO2 analyzer
 - ▶ Reliable dual showerhead equilibrator
- ▶ Flow-through
 - ▶ Easier to control biofouling and maintain
 - ▶ Modular (easy to add more sensors)

Approach

Design Advantages

- ▶ Dock mounted and grid powered w/ Cellular telemetry
 - ▶ Reliable platform with ease of access
 - ▶ High data collection rate
- ▶ Multi-tiered data storage
 - ▶ Up to 6 months of local storage at 10' data collection
 - ▶ Dedicated RDMS server at UMB
 - ▶ Proposed data share on NERACOOS portal
- ▶ Climate controlled sealed enclosure
 - ▶ Ready for year-round use
 - ▶ Unobtrusive marine deck box

System

System

System

Refinements/adaptations to the site

Challenges

- ▶ Constant flow with 12ft tides
- ▶ What happens on exceptionally low tides
- ▶ Dock can get significant splash over during storms
- ▶ Floating pump for constant-depth sampling
- ▶ Icing control
- ▶ From prototype to production with 1 iteration
- ▶ Limited budget

Budget

Item	Cost
pCO2 sensor	26000
pH sensor	12000
Pump	2000
Thermosalinograph	6000
infrastructure	6000
CO2 gas standards	3000
pH standards	3000
Power	1000
Cell	1500
Maintenance	5000
Desecrate Sampling and Analysis	5000
Build Labor	25000
Research	10000

Project Timeline

Summary/Conclusions

- ▶ Proven pH and pCO₂ sensors
- ▶ Integrated design in robust dock-side package
- ▶ Low-cost maintenance
- ▶ Integrates with additional sensors
- ▶ Provide data in near real-time
- ▶ Integrates with NERACOOS data portal
- ▶ Scheduled visits to the system to collect discrete samples to groundtruth the data

Thank you!
